Before the next challenge.

My name

Paulina Ramirez

A question I want to resolve

How should I approach game development?

Recall. Question. Recalibrate.

What have I completed?

One of the things I've completed is during week 8 I supported my team in creating a music player and structuring our work. I helped organize our repository, folders, evidence, and helped organize our goals/requirements. I know how to work with ai and use it for feedback and efficiency.

My explanation of classes, objects, data and actions

A class is like a template for building something. Classes have objects, attributes and methods. An object is made from a class and it had attributes that describe it. Actions are like functions or methods. It defines what the object can do.

My questions, answers and remaining uncertainty

Question: Why should AI be a part of the team? Answer: AI is a tool that can be used in a team for efficiency and things like debugging or developing ideas for a project/game.

My personal GitHub repository URL

https://github.com/rlina19/CS110-Paulina/tree/main

Readiness check

I can open my projects in Unity. The project on Unity from 11a is saved and works when opened.

Replace Chapters with Pipelines

Attention First, Chapter 3, pp. 37–41 (132-page edition).

What I understand from this chapter

A pipeline is a structure that helps you move as you learn. Nodes are actions that help you get further in the process. There are 3 fundamental pipelines. The 1st pipeline is important information. You start with questions. What are you building? What will it do? These questions are the information for whatever outcome you are seeking. Pipeline 2 is The Begining. These are your tools, materials etc. This is basically the setup. Pipeline 3 is storytelling. Storytelling is important because it's the foundation for what you are creating or doing. Everything needs a purpose. Basically everythng needs structure and what you do needs purpose, a story. This way you can create anything with the creator mindset

My opinion and reasons

I agree that everything needs a structure and the pipelines help us set up that structure. For example on Tuesday we used Unity and even though it was my first time I was able to use it and understand what I was doing because I've used Visual Studio before, Ive used C# and using my past experienceI was able to figure out what I dont know using what I do know. Using the creator mindset I can switch "hats" and reach my goal

A decision I can apply

I can apply the pipelines too what I do whether its learning a subject, learnng how to use tools, or creating something I can refer to the pipeline. Ask why it's important and its purpose, figure out what I need and then use what I know to learn what I need to learn.

A question or next investigation

How can we apply the creator mindset outside of just education.

Design for the Attention Economy

Attention First, Chapter 6, pp. 53–58 (132-page edition).

What I understand from this chapter

I understand that attention is an important part of learning and that sometimes the learning environment itself makes it difficult to focus. Distractions unclear instructions and repetitive tasks can make learning harder.

My opinion and reasons

I agree with the chapter because I think attention plays a huge role in how people learn. In todays world there is a lot of distractions that can make it hard to focus.

A decision I can apply

I can apply this by reducing distractions in my environment. I can also try to connect with what Im learning to remember it.

A question or next investigation

I can investigate how we can limit our distractions today when we have social media and all sorts of digital platforms around us trying to steal our distraction.

Identity and the Creator Loop

Attention First, Chapter 7, pp. 61–69 (132-page edition).

What I understand from this chapter

People shape their identity through experiences and changes. It's important to know that you can make changes and you have to make changes to reshape your identity. We can make these changes through learning and practicing new things. It's also important to be your number one fan.

My opinion and reasons

I agree with this chapter and I agree that its important to recognize where we have holes and use our past experiences to change and re shape our identity.

A decision I can apply

I can apply this to my life and when I make mistakes or go through rough times I can use that as a tool to learn and grow and change my identity.

A question or next investigation

How do you recognize what to use as a tool, from your experiences, to grow and change

Designing Your Teams and Tools

Attention First, Chapter 8, pp. 71–74 (132-page edition).

What I understand from this chapter

Teams and tools go hand in hand. Its important to understand how tools and team members work together. Tools help us do things and team members help change our perspective, the way we create, or decide things. Masters vs chiefs. A master focuses on the details while a chief focuses on the directions.

My opinion and reasons

I agree that having a good team and tool mindset is important to create good things.

A decision I can apply

To my team I can contribute by being a tool when they need my skills, and a team member by working together and pitching in.

A question or next investigation

How can we work as a team so that everyone pitches in their ideas and taking different roles too contribute our skills.

The Human Operating System

Attention First, Chapter 11, pp. 93–103 (132-page edition).

What I understand from this chapter

People need to balance memory attention imagination and tools. Intelligence is not wisdom. Balancing creativity and exploration with structure and responsibility. People need freedom to imagine and experiment but they also need organization and discipline to turn ideas into meaningful results. This is the human operating system.

My opinion and reasons

I agree with this because its important to not put all your focus on just one thing and thinking if what youre doing actually matters. I also agree that balance is important because there needs to be structure and attention and creativity but too much of one will create issues.

A decision I can apply

I can apply balance to things like school. I can make sure to create a balance between structure and freedom and creativity and responsibility.

A question or next investigation

How can people develop better judgment and discipline while still keeping their creativity alive?

Bring something to the summit.

The connection across the readings

The pipeline is important, it helps create structure and a plan to follow. Attention is crucial especially when there are so many things stealing our attention today. The pipeline is especially important as well as the creator mindset because with the pipeline we know how to approach any problem and how to solve it even with limited knowledge.

Evidence I am ready to show

I still need to learn to adopt these mindsets, like the tool and team mindset and contribute more to my team with what I can offer. It's important for teammates to work together and take on different tasks and roles.

My board in words

The goal is at the finish line. We have the story, the setup, and resources. All team members have assigned roles to which they contribute their skills to. The story is the reason why we create what we do, the setup is our structure we follow, like the creator mindset and using the pipeline.

Choose where you want to go.

My direction

Join a lead

The mission I want to explore

Our group lead, Lexie, pitched the idea of a game in which a user looses their memories and travels through spaces to find the purpose of the game and learn more about themselves. I want to explore this idea and see how we can build this story completely so that we are able to execute it as a game.

My pitch

What I bring to the team: Organization, keeping structure and meeting goals.
My next actions are to continue working with my team members to help organize our ideas, story, and game plan.

Conversations and decisions

I spoke with Lexie, David, Rudy, Leah and Sam. We decided to merge teams with Duff Beer. We worked through some story ideas, decided it was important we complete the entire story before jumping into anything, and came up with new ideas for the game and how to create the vibe we wanted it to give. The goal is to make the game feel unsettling to the player.

Agree on the work.

Team name / solo mission

DuffAyzo

Agreed lead / my name if solo

Lexie

Accepted members and contributions

Lexxie - Team Lead
David - Coordinator and documenter
Rudy - Creative Ideas
Paulina - Product manager
Sam - Support visual ideas
Vin - Ancho points
Leah - Pending
Nico - Pending
AI - Brainstorming and notes

How the literature strengthens this team

This team will have to work as a team by contributing skills we can each bring. Understanding teams or tools will help us work together and succeed as a team. It's also important to have the right mindset in a team. Going back to the pipeline we know that an important step is the story. This is why our team decided to focus on completing and organizing the complete story, even the backstory that the players may never actually know. Storytelling gives meaning, it gives clear actions and purpose.

Communication and check-in plan

Work will happen in class and communication will be through Discord.

Team GitHub URL, or Working solo

https://github.com/Lexicon-Lexxie/CS110-Awayzo/tree/main

Make the Attention Accord.

Purpose and smallest playable result

The player will join the game and be able to move around. They may be able to interact with objects around them.

My attention promise

We want the player to experience the game. Lexie use Unity to create a first scene and record evidence. I will make sure we meet any requirements and organize what we have.

Time and dependency plan

The first action is building a first scene. To do this we also have to decide what we want to happen in the opening and complete any missing story parts. I will track deadlines.

Board explanation and contributors

To develop the story, team members used anchor points to bring new ideas. Some tools we must use include C#, Visual Studio, Unity, Github, and AI. We want the player to travel through the game and gain details to regain pieces of their lost memory.

Translate the mission into code.

My story-to-code map

Object: A player (like a 3d model) Class: Player class Properties: a 3d character that is human like. Methods: walk() would make the player walk and run() would make the player move faster/ sprint. When the player wants to move forward, they can use their keyboard to move forward or back. To sprint they can click shift which would activate run().

What I am borrowing and why

I can borrow Unity's 3d project and 3d models.

Object lifetime and responsibility

The Player object is created when the main game scene loads and remains active throughout the player's exploration of the scene.
The Player object is responsible for capturing real time keyboard inputs (such as WASD for walking and Shift for running), updating its position and managing the player's navigation through the environment.

Make one moment playable.

What I expect to happen

I expect the character to walk around.

What I built and where it lives

Not recorded

A difficulty and my response

Not recorded

Test what you are claiming.

My test record

Movement: use WASD to move around.

My improvement experiment

Player uses wasd to walk - player uses shift to sprint -

Promised versus returned evidence

A framework to follow

Return with work you can explain.

My final access and file check

My next decision

I will investigate how to better use Unity so I can contribute more to my team and I will also focus on supporting my team by contributing ideas and using my skills to help organize our ideas, information and evidence.

Handoff

Commit and push your own project, notes, report, boards and tests. Verify file/image/link access. Include your team GitHub link if teamed. Submit one personal GitHub URL in your own Canvas record.
